Now we need to manually brute force our VM and check whether our automation is working properly.

Before a brute force attempt:

The screenshot shows the Microsoft Sentinel 'Incidents' page. The left sidebar contains navigation options like General, Threat management, Incidents, Workbooks, Hunting, Notebooks, Entity behavior, Threat intelligence, MITRE ATT&CK, SOC optimization, Content management, Content hub, Repositories, and Community. The main area displays 'Open incidents by severity' with counts for Open (0), New (0), and Active (0) incidents. Below this, a search bar and filters for Severity, Status, Incident Provider name, Alert product name, and Owner are visible. The status is set to '2 selected'. A message states 'No incidents were found' with an explanation of what incidents are and how they work.

After a brute force attempt:

The screenshot shows the Microsoft Sentinel 'Incidents' page after a brute force attempt. The 'Open incidents by severity' section now shows 1 Open incident, 0 New incidents, and 1 Active incident. The severity filter is set to 'High (1)'. A table lists the incident with the following details:

Severity	Incident number	Title	Alerts	Incident provider na...	Alert product name	Created time	Last update
High	9	Brute Force Attack (Multi...	1	Microsoft Defender ...	Microsoft Sentinel	07/28/25, 12:19 PM	07/28/25, 12:19 PM

The right sidebar shows details for the selected incident, 'Brute Force Attack (Multiple failed login attempts)'. It includes the incident number (9), owner (Mitesh Rathod), status (Active), and severity (High). The 'Alert product names' section lists 'Microsoft Sentinel'. The 'Tasks' section shows '0/1 completed'. The 'Evidence' section shows '1 Events', '1 Alerts', and '0 Bookmarks'. The 'Last update time' is '07/28/25, 12:23 PM' and the 'Creation time' is '07/28/25, 12:19 PM'. The 'Entities' section is empty. A note at the bottom states: 'The investigation graph requires that your incident includes entities (for example: user, host, IP, etc.). Use the entity mapping option when defining your alerts. Learn more.' There are buttons for 'View full details' and 'Actions'.

Investigation Steps

For SOC L1 Team:
Please do following investigations:

1. Identify targeted accounts and source IP's.
2. Check number and speed of failed attempts.
3. Look for successful logins after failures.
4. Analyze IP reputation and geo-location.
5. Review other activities linked to attacker.

Recommendations:

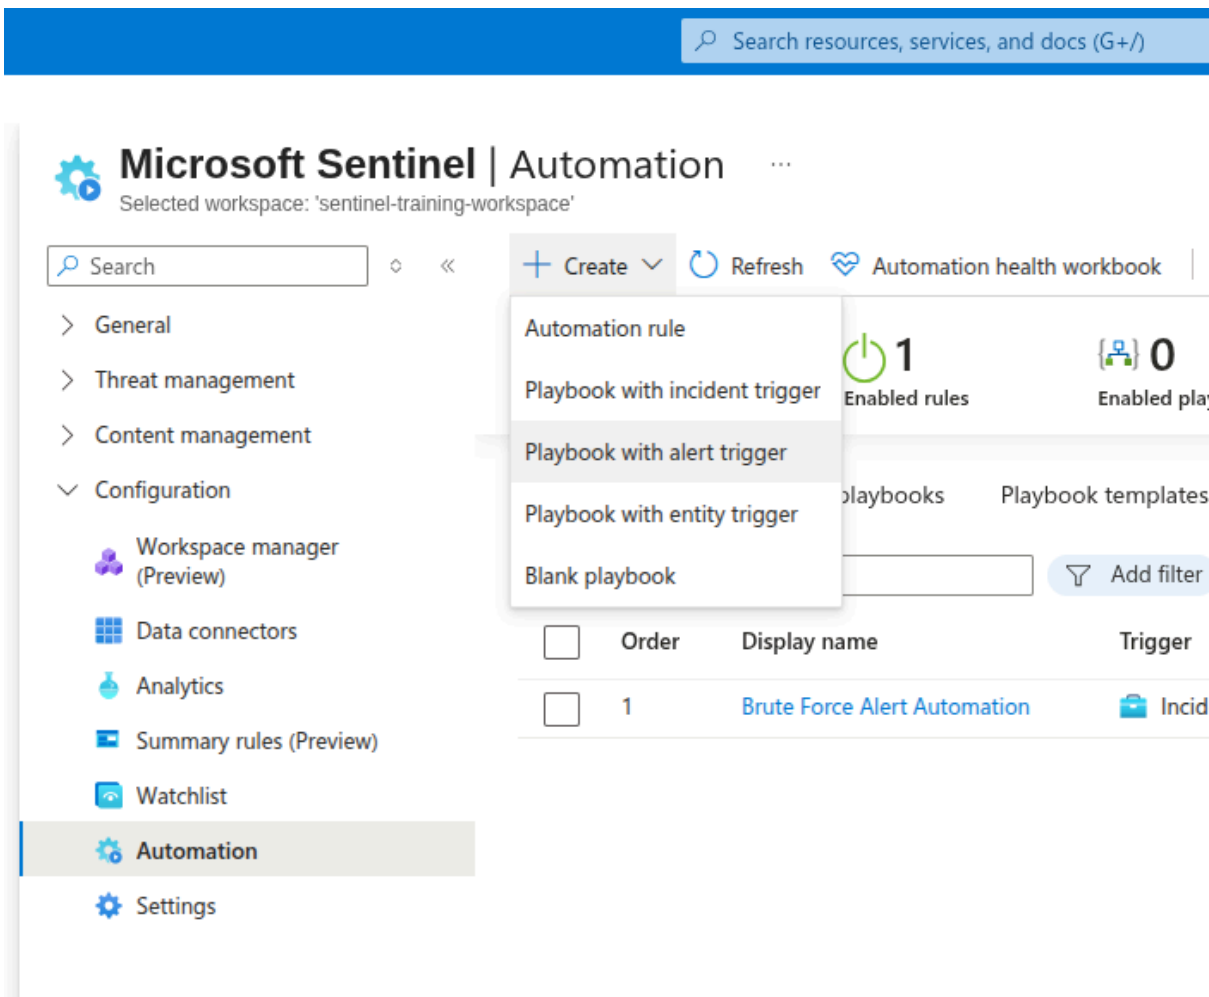

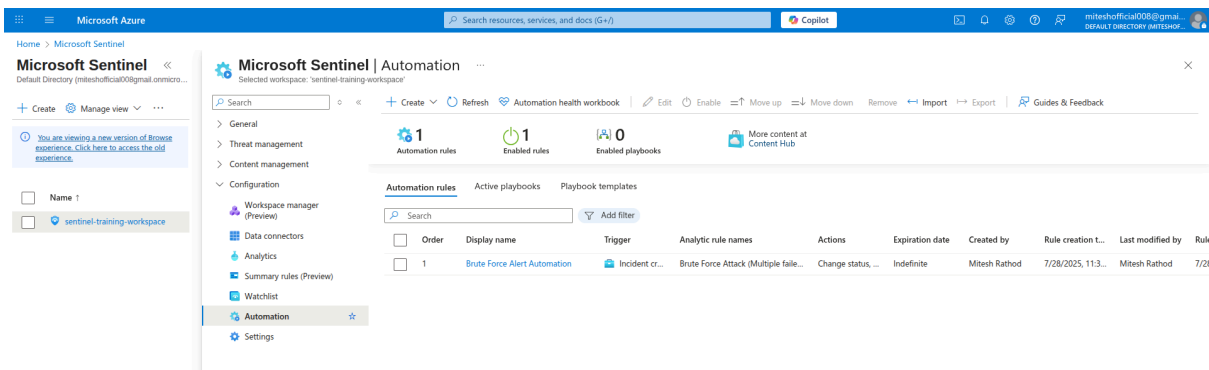

1. Enforce multi factor authentication (MFA).
2. Implement account lockout policy.
3. Block geo-based malicious IP addresses.
4. Strengthen password policies.

Thanks & Regards

Sentinel Team

 Overview

Now it's time to test our playbook, for which I will use a previously generated incident and run the playbook manually just to test whether we are receiving email or not.

When you click on run you will encounter an error on running the playbook, as by default, MS Sentinel doesn't give access to the resource group for running the playbook, so we need to give access to our resource group for running the playbook.

Entity behavior analytics

What is it?

Microsoft Sentinel's user and entity behavior analytics (UEBA) transforms raw data into meaningful insights to help identify advanced attacks. It creates comprehensive profiles of users and entities' behavior, uses machine learning models for peer analysis and blast radius (impact on the organization) to create the context for determining anomalous behavior, and adds detected anomalies to the contextual and behavioral insights for selected data sources. [Learn more about identifying threats with Microsoft Sentinel UEBA.](#)

How to enable it

To turn on Microsoft Sentinel's UEBA in just a few easy steps, select **Set UEBA** below and follow the on-screen instructions to select identity providers and data sources. See [Enable User and Entity Behavior Analytics \(UEBA\) in Microsoft Sentinel](#) for more information.

Set UEBA

Anomalies

Microsoft Sentinel provides a rich set of behavior analytics to detect anomalous activities in your environment. These activities are stored in the Anomalies table in your workspace. You can use them in scheduled analytics (detection) rule queries, hunting queries and investigations. You can also customize the parameters of the machine learning (ML) models to improve the precision of the anomalies. Microsoft uses 30 days' worth of active data to train the ML models. This data is cached and encrypted with Microsoft keys regardless of the customer-managed key configuration.

only a global Administrator or a Security Administrator in your Microsoft Entra ID can turn this feature on or off

On

UEBA anomalies will be enabled after [selecting data sources for UEBA](#)

[Go to analytics in order to configure the anomalies >](#)

Automation

Settings

The Microsoft Sentinel Contributor role assignment is required on the central workspace (where workspace manager is enabled), and on the member workspaces) the contributor needs to manage. To learn more about roles in Microsoft Sentinel, see [Roles and permissions in Microsoft Sentinel](#).

Enable Azure Lighthouse if you're managing workspaces across multiple Microsoft Entra ID tenants. To learn more, see [Manage Microsoft Sentinel workspaces at scale](#).

Make this workspace a central workspace.

Off

Playbook permissions

What is it?

Automation rules allow you to centrally manage all the automation of incident handling. Automation rules streamline automation use in Microsoft Sentinel and enable you to simplify complex workflows for your incident orchestration processes.

Playbook permissions

Microsoft Sentinel automation rules can run Logic App playbooks to integrate with other services or create complex logic chains for incident handling. Explicit permissions are required to use this functionality.

Configure permissions

How do we use your data?

Reply Forward

Building Playbooks with Azure Logic Apps in MS Sentinel (It automatically looks up the geolocation, eg, country, city of any IP addresses found in an MS Sentinel. Then it tags the incident with that geolocation information for easier investigation.)

The screenshot shows the Microsoft Sentinel Content hub interface. On the left is a navigation pane with categories like Incidents, Workbooks, Hunting, Notebooks, and Content management. The 'Content hub' is selected. The main area displays a list of solutions. At the top, there are statistics: 412 Solutions, 318 Standalone contents, 2 Installed, and 0 Updates. A search bar is present. Below it, a table lists solutions. The 'Microsoft Sentinel Training Lab' is highlighted with a blue checkmark in the selection column. To the right of the table, there is a detailed view for the 'Microsoft Sentinel Training Lab', showing its description, content type (Analytics rule, Hunting query, Watchlist, Workbook), category (Training and Tutorials), and pricing (Free). An 'Install' button is visible at the bottom right of this panel.

Content title	Status	Content source	Provider	Support
KQL Training	Not installed	Solution	Community	Community
Microsoft Sentinel Training Lab	Not installed	Solution	Microsoft	Microsoft

The screenshot shows the Microsoft Azure portal interface. At the top is a blue header with the 'Microsoft Azure' logo and a search bar. Below the header, the breadcrumb navigation shows 'Home > Microsoft Sentinel | Content hub >'. The main heading is 'Microsoft Sentinel Training Lab Solution', followed by 'Microsoft Sentinel, Microsoft Corporation'. Below this is a shield icon and the title 'Microsoft Sentinel Training Lab Solution' with a heart icon and 'Add to Favorites'. Underneath, it says 'Microsoft Sentinel, Microsoft Corporation | Azure Application' and shows a star rating of '★ 5.0 (3 ratings)'. There are two dropdown menus: 'Subscription' set to 'Azure for Students' and 'Plan' set to 'Microsoft Sentinel Training Lab Soluti...'. To the right of these dropdowns are two 'Create' buttons. The background is a light blue gradient.

Overview

Now, to check our playbook is running properly or not we will select an incident and run our playbook to get geo information of attackers.

The screenshot shows the Microsoft Sentinel 'Incidents' page. The left sidebar contains navigation options: General (Overview, Logs, Guides, Search), Threat management (Incidents, Workbooks, Hunting, Notebooks, Entity behavior, Threat intelligence, MITRE ATT&CK (Preview), SOC optimization), Content management (Content hub, Repositories, Community), and Configuration (Workspace manager). The main area displays a table of incidents with columns: Severity, Incident number, Title, Alerts, Incident provider name, and Alert product name. The table shows 8 open incidents, with 7 new and 1 active. The incidents are filtered by severity (All) and status (2 selected). The detailed view on the right for incident number 7 shows it is 'Unassigned' with a 'New' status and 'Medium' severity. It includes evidence (5 events, 5 alerts, 0 bookmarks), last update time (08/01/25, 09:30 AM), creation time (07/31/25, 11:02 AM), and entities (175.45.176.99). The incident title is 'Sign-ins from IPs that attempt sign-ins to disabled...'. The incident provider name is 'Microsoft Defender ...' and the alert product name is 'Microsoft Sentinel'.

Severity	Incident number	Title	Alerts	Incident provider name	Alert product name
Medium	7	Sign-ins from IPs th...	5	Microsoft Defender ...	Microsoft Sentinel
High	8	Solorigate Network ...	5	Microsoft Defender ...	Microsoft Sentinel
Medium	6	Malicious Inbox Rul...	5	Microsoft Defender ...	Microsoft Sentinel
High	5	Brute force attack (...)	1	Microsoft Defender ...	Microsoft Sentinel
High	4	Audit logs cleared (...)	1	Microsoft Defender ...	Microsoft Sentinel
High	3	Brute force attack (...)	1	Azure Sentinel	Microsoft Sentinel
High	2	Brute force attack (...)	1	Azure Sentinel	Microsoft Sentinel
High	1	Brute force attack (...)	1	Azure Sentinel	Microsoft Sentinel

Before running playbook, we don't have geo location of attacker under "Tags" as you can observe.
